## The MagicMetric Coaching System in the NBA

## Overview

The MagicMetric is a basketball player rating system created by two math majors who shared coaching duties on several Industrial and Church league teams. It is an Acronym for the Mays And Gantner Index of Contribution (MAGIC), so named for its co creators, Dick Mays and Jeff Gantner.

Dick and Jeff created the rating system primarily to rate the players on their own basketball team. But as a player rating system, this measure can also be used to rank the players in any league. This paper provides a complete ranking of all the NBA players for the 2011-2012 season. The casual reader may wish to go straight to the appendix for this listing. The rest of the paper is intended for readers with an interest in coaching.

The Magic Metric Coaching Systems, (a.k.a.) Rotation System, is a simple way to decide on player substitutions. It predefines the rotations to be used during the game, based on the Magic Metric player ratings. Although the Rotation System and the Player Rating are two separate ideas, they were conceived at the same time. Technically, the rotation system could be used with a different player rating system.

This paper examines the feasibility of actually using the rotation system in the NBA.

## Introduction

The topic of how to rate the performance of basketball players has been the subject of many papers and more than a little controversy. TENDEX, by David Herron may have been the first such rating system. TENDEX used a linear system of weights; however, Mr. Herron used a subjective evaluation for the relative contribution of each stat. Dick and Jeff initially tried to use TENDEX as a rating system, but felt that it didn't quite have the right weights associated with the coefficients. Being math majors, they did their own analysis of the problem, which led to the coefficients used in the Magic Metric.

A separate paper addresses how the MagicMetric is derived from solving a system of linear equations. As it turns out the most important factor is the expected "points per possession" to properly determining the coefficients. Using an average points per possession of 1, the coefficients are approximately:
$\mathrm{MM}=.65 \mathrm{REB}+.9 \mathrm{AST}+.8 \mathrm{BLK}+\mathrm{STL}+1.8 \mathrm{FG} 2+3 \mathrm{FG} 3+.9 \mathrm{FT}-\mathrm{TOV}-.65 \mathrm{FGM}-.5 \mathrm{FTM}$
FG2 $=2$ point Field goals made
FG3 $=3$ point Field goals made
FT = Free throws made
FGM = Field goals missed.
FTM = Free throws missed.
And the other stats are rebounds, assists, blocked shots, and turnovers.
The expectation of 1 point per possession is reasonable good as a statistical measure of NBA and college players. When measuring high school players .8 points per possession
(ppp) may a better measure. Youth basketball might have .6 or .5 points as an expectation, and a young girls team might be down as low as .2 points per possession. This paper explains the derivation and gives the coefficients for different values of ppp.

## http://www.upct.es/~beside/Textos/MagicMetric.pdf

## Limitations

The Magic Metric does not measure every statistical form of contribution. In particular, there are several ways players contribute that are not measured statistically. A player might screen an opposing player from a retrieving a loose ball headed out of bounds, but may not get credited for the rebound. A player taking a charge or forcing a jump ball might not get credited with a steal. Coaches using the magic metric to determine player value may want to add these categories to the basic formula. Taking a charge should be valued at least as much as a steal as it results in a change of possession.

Even though the metric does not measure every stat, it is still an excellent tool to measure the relative value of players on the same team. The missing types of contribution are missing for every player so the stats typically kept for a basketball game are sufficient to judge the relative player's effectiveness on the court.

## Ranking NBA Players

The magic metric has more valid sources of criticism when used as a tool to rank players on different teams. The game pace of one team might result in more possessions per minute than another team. As the contribution tends to be related to the number of possessions, a player on a fast paced team may have a slightly higher metric than if he played on a team that featured more of a half court offense.

But suppose we do want to use the magic metric to rank NBA players. What is the more valuable information, the Magic Metric per game, or the Magic Metric per minute? As it turns out, both are important measurements.

For several years website magicmetric.com analyzed all NBA and player performances on a nightly basis. Without corporate sponsorship, the site was shut down after four years, but some interesting lessons were learned. The average NBA player had a performance rating of about .37 per minute (MM/min). However an average regulation game had a Total Magic Metric of 97 so the average contribution of players on the court was just above .4 per minute. 48 minutes * 5 players * $.4=96$.

How can the average contribution per player on the court be above .4 when the average NBA player is .37 per minute? The answer is simple. The better players play more minutes so the average per minute on the court is higher.

As a general rule of thumb, any player with a rating of $.4 /$ minute is a better than average player. A rating of .5 per minute is a candidate for the All Star team, and a rating of .6 per minute is a superstar in the league. The very rare player, e.g. Shaq in his prime, has a rating above .7 per minute, and achieving this rating is almost a lock for MVP.

These stats were gathered some dozen or so years ago, around 1998-2003. How well do they hold up today? In the 2010-2011 season, no player achieved a MM/minute rating of .7. In 2011-2012, Lebron James had a metric of .74, and justly won the MVP. This same season six other players had a rating per minute over . 6

| Player | MM/Min | MM/game |
| :---: | :---: | :---: |
| Kevin Love | 0.66 | 25.8 |
| Kevin Durant | 0.66 | 25.7 |
| Chris Paul | 0.63 | 23.1 |
| Tim Duncan | 0.62 | 17.6 |
| Dwayne Wade | 0.61 | 20.7 |
| Dwight Howard | 0.61 | 23.3 |

Table 1.
All of the players listed in Table 1 are recognizable superstars. But where is Kobe Bryant? Is Tim Duncan really a better player than Kobe? Kobe has a . $57 /$ minute contribution but plays 38.7 minutes per game for an average game contribution of 22.2. Tim Duncan only plays 28.6 minutes a game for a 17.6 per game contribution.

Fatigue plays an issue as a player increases their minutes on the court. It is doubtful that Tim Duncan could still sustain a rating above .6 per minute if he had to play 38 minutes per game.

People wondered why Lebron James seemed to disappear in the fourth quarter in last year's playoffs against Dallas, but one only has to look at the box scores to see he was on the court $90+\%$ of the minutes. During the regular season LeBron played 38 minutes per game. During the finals with the Mavericks he averaged $\wedge \% \wedge \& \% \wedge$ this may not seem like a but when viewed from a "minutes of rest" perspective, 12 minutes of rest is three times higher than four minutes of rest. It is not surprising that LeBron did not perform as well playing 45 minutes per game as he did during the regular season playing 38 minutes per game.

The fact that a players per minute rating goes down as the minutes on the court goes up seems indisputable. But how much rest does a player need to perform at his best? Tim Duncan is currently playing 28 minutes a game but still has a superstar per minute rating. What would Kobe's metric be if he were to play less minutes? What is the optimal number of minutes on the court. We don't have exact answers for any of these interesting questions, but we will address the issue when discussing the rotation system.

To determine the NBA's best players, we decided to take into consideration both the total contribution per game as well as the contribution per minute.

Table 2 shows our rating of the 30 best NBA players for 2011-2012

| rank | Player | MM/g | MM/min | Mprod | Hoopsta ranking |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | L. James | 27.95417 | 0.739528 | 20.6729 | 1 |
| 2 | K. Love | 25.8 | 0.661538 | 17.06769 | 2 |
| 3 | K. Durant | 25.66667 | 0.661512 | 16.97881 | 3 |
| 4 | C. Paul | 23.11901 | 0.629946 | 14.56373 | 6 |
| 5 | D. Howard | 23.26019 | 0.607316 | 14.12627 | 4 |
| 6 | K. Bryant | 22.21 | 0.573902 | 12.74636 | 13 |
| 7 | D. Wade | 20.68983 | 0.612125 | 12.66477 | 14 |
| 8 | B. Griffin | 21.14156 | 0.584021 | 12.34711 | 7 |
| 9 | A. Jefferson | 20.45462 | 0.599842 | 12.26954 | 8 |
| 10 | D. Rose | 20.695 | 0.586261 | 12.13266 | 19 |
| 11 | R. Westbrook | 20.61933 | 0.582467 | 12.01008 | 16 |
| 12 | J. Smith | 20.47254 | 0.575071 | 11.77317 | 12 |
| 13 | A. Bynum | 20.44167 | 0.574204 | 11.73769 | 5 |
| 14 | L. Aldridge | 20.60091 | 0.567518 | 11.69139 | 10 |
| 15 | D. Nowitzki | 19.45682 | 0.575646 | 11.20023 | 22 |
| 16 | D. Williams | 19.91455 | 0.54861 | 10.92532 | 28 |
| 17 | C. Anthony | 19.44 | 0.560231 | 10.89088 | 26 |
| 18 | T. Duncan | 17.64015 | 0.616789 | 10.88024 | 25 |
| 19 | D. Cousins | 18.19063 | 0.596414 | 10.84914 | 21 |
| 20 | P. Gasol | 19.84545 | 0.53205 | 10.55877 | 9 |
| 21 | K. Garnett | 18.34167 | 0.571391 | 10.48027 | 15 |
| 22 | D. Lee | 19.64825 | 0.528179 | 10.37778 | 11 |
| 23 | P. Millsap | 18.35588 | 0.55793 | 10.24129 | 17 |
| 24 | K. Irving | 17.50784 | 0.574028 | 10.04999 | 42 |
| 25 | T. Parker | 18.01912 | 0.556146 | 10.02125 | 37 |
| 26 | M. Gortat | 17.72803 | 0.554001 | 9.821346 | 18 |
| 27 | G. Monroe | 17.5 | 0.555556 | 9.722222 | 24 |
| 28 | P. Pierce | 18.27192 | 0.526568 | 9.621412 | 30 |
| 29 | R. Rondo | 18.89922 | 0.502639 | 9.499481 | 23 |
| 30 | S. Curry | 16.31538 | 0.580619 | 9.473017 | 53 |

Table 2.
Our rating is based on Mprod, which is the Product of MM/game and MM/minute. This gives equal weight to both the per game Magic Metric, and the per minute rating. For comparison purposes, the ranking from hoopstats.com is included. The hoopstat.com rankings are based on a statistic called Player Efficiency.

The top three positions are the same under both rating systems. But the Magic Metric rating system has Kobe Bryant, Dwayne Wade, and Derrick Rose in the top ten in place of Andrew Bynum, Paul Gasol and LaMarcus Aldridge. From our subjective point of view, there Magic Metric ranks seem more accurate. Not many general managers would trade the first three of these players for the second three. The appendix provides a complete ranking for all the NBA players in the 2011-2012 season.

## The MagicMetric Rotation System

As a player rating system, the Magic Metric appears to have substantial merit in determining relative contribution of players. How can a coach use this information for the betterment of his team? One way is as a private tool to analyze performance, and provide coaching tips to individual players. If the turnovers are too high, a player may be advised to avoid dribbling into double teams. Another way is to share the metric openly with players. Players are competitive, and seeing their metric may motivate them to improve their individual performance and result in better overall team play.

A third way of using the metric is more controversial. We can actually use the metric to determine player substitution patterns. The idea is to maximize the total average contribution on the court by playing players with higher metrics more minutes than players with lower metrics.

This flies in the face of conventional wisdom, in which players are assigned a position, Center, Forward, or Guard. The Magic Metric Rotation System predetermines the player substitution pattern without any consideration for the "position" of different players. A group of players is chosen for the court based only on a relative sum of their contributions and it is expected that this group will be able to find a way to play together.

The substitution pattern does not take into consideration which of the opponent's players are on the court, or the game situation. A lot of armchair coaching is based on perception of defensive "matchups," and the coach is expected be influenced by which of the opposing players are the court. One high school coach, who started to use the rotation system caved into public pressure and began starting his best five players because he couldn't politically survive with a coaching system that did not require him to make game time substitution decisions. Parents can be a harsh jury.

It is easy to list a lot of objections to this method of coaching a basketball game. But the fact is, over about eight seasons of play in church and industrial leagues, the rotation system seemed to work very well. Our examples will attempt to explain why this is so. Table 3 illustrates a sample Magic Metric rotation system.

|  |  | $1^{\text {st }}$ Half |  |  |  | $2^{\text {nd }}$ Half |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Player | height | 20:00 | 14:00 | 10:00 | 6:00 | 20:00 | 14:00 | 10:00 | 6:00 | Playing Time |
| Adam | 6'5 | X | X |  | X | X | X |  | X | 32 |
| Bruce | 5'10 | X |  | X | X | X |  | X | X | 32 |
| Carl | 5'11 |  | X | X | X |  | X | X | X | 28 |
| David | 6'4 |  | X | X |  | X | X |  | X | 24 |
| Eli | 5'8 | X |  |  | X |  |  | X | X | 22 |
| Frank | 5'11 | X |  | X |  | X |  | X |  | 20 |
| George | 5'10 |  | X |  | X |  | X | X |  | 18 |
| Howard | 6'1 |  | X | X |  | X |  |  |  | 14 |
| Isaiah | 6'0 | X |  |  |  |  | X |  |  | 10 |

Table 3.

Each twenty minute is broken into four substitution intervals, with the time on the clock shown at the top. The players are seeded based on their magicmetric/minute rating. The talent level is relatively even until the last rotation.

The last rotation is the only one in which the five best players are on the court at the same time. This rotation has been dubbed "The Finishng Five." Many players are accustomed to some prestige being associated with the "Starting Five," but it is the Finishing Five that is has the highest glory using the Rotation System.

## Genesis of the Rotation System

The original idea behind the rotation system was to simply divide playing time among players in an industrial league in a manner that was fair. The focus was on remaining competitive, but not necessarily field the strongest team. The main reason the best five players were scheduled to play together at the end of the game, was to allow for more playing time for the lower rated players in the event of a blowout. Table 4 illustrates the playing time if either team has a large lead before the final rotation.

|  |  | $1{ }^{\text {st }}$ Half |  |  |  | $2^{\text {nd }}$ Half |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Player | height | 20:00 | 14:00 | 10:00 | 6:00 | 20:00 | 14:00 | 10:00 | 6:00 | Playing Time |
| Adam | 6'5 | X | X |  | X | X | X |  |  | 26 |
| Bruce | 5'10 | X |  | X | X | X |  | X |  | 26 |
| Carl | 5'11 |  | X | X | X |  | X | X |  | 22 |
| David | 6'4 |  | X | X |  | X | X |  |  | 18 |
| Eli | 5'8 | X |  |  | X |  |  | X | X | 22 |
| Frank | 5'11 | X |  | X |  | X |  | X | X | 26 |
| George | 5'10 |  | X |  | X |  | X | X | X | 24 |
| Howard | 6'1 |  | X | X |  | X |  |  | X | 20 |
| Isaiah | 6'0 | X |  |  |  |  | X |  | X | 16 |

Table 4. (blowout)
The rotation system was designed to remove griping about playing time. All players were objectively measured and given playing time based on performance. In a blowout, the playing time is fairly evenly divided between all the players.

The first season we used the rotation system, it was an immediate success. As expected, the rotation system almost completely eliminated any complaints over playing time. But counter to intuition, the team's winning percentage also improved remarkably.

Since we were playing our best players more minutes before we started using the rotation, our intuition was that we might not do as well as a team. However, we went from a team winning $30 \%$ of its games to a team winning $60 \%$ of its games. Why did this happen? There are many reasons for this improvement. Some are speculation some are supported with hard data. A paper seeking to explain the reasons for the success of the rotation system in recreational leagues can be found here:
http://www.upct.es/~beside/Textos/MMCoachingSystem.pdf

## Analysis of player rotations

If the rotation system is good in a recreational league, might it also be effective in the NBA? We can examine the chief complaint lodged against the rotation system in the context of recreational league play, then we will look at actual NBA team lineups and examine what problems could arise, using the rotation system.

To illustrate the chief complaint we will create an imaginary team in which one of the rotations seems to be almost unworkable. Table 3 include players height for nine players, with the average height just under 6'. This is fairly typical for a Church or Industrial league.

This ensures a relatively competitive lineup for every rotation. At least three of the strongest five players are on court at the same time. In the above example, the players are listed in alphabetical order as strongest to weakest players.

A detractor may look at the rotation system and be appalled that in rotation 7 all of the players on the court are under 6' tall. How can this work in practice?

Let's give an imaginary Bio for the players, to examine in detail this problem.
Adam, the best player on the team. Kind of Kevin McHale type, a natural forward, but can play the center position as well. Best rebounder on the team and second best scorer.

Bruce, the best ball handler and shooter on the team. A natural point guard, smart and rarely makes mistakes with the ball. The leading scorer and only person who can create is own shot.

Carl, a fairly good ball handler and a good 3 point shooter. Also hits the boards fairly well, because of his leaping ability.

David a two hundred and fifty pound guy, who always plays center when in the game. He is the second best rebounder, but rarely shoots anything but a lay up.

Eli, a small guy who is very fast and hustles. Loves to cut back door for layups. Farily good ball handler. Not much of a rebounder

Frank, A decent Jack of all trades player. Slightly overweight, doesn't try to do too much with the ball, but a reasonable shooter if left open.

George, an older middle aged guy, who can't jump, and is a bit heavy which helps him boxes out well and push on defense. Tends to foul shooters rather than give up a layup.

Howard, a thin young player who can jump high, but doesn't like contact. Tends to hand out at the three point line to jack up a three, which he can hit $30 \%$ of the time. Doesn't like to play in the paint so he can't be a Power Forward or Center.

Isaiah. The coaches son. Youngest player on the team at 16. Doesn't take open shots for fear that he might miss. Collects an occasion rebound, and a decent on the ball defender. Pretty quick, but prefers to passes the ball rather than dribble.

In table five, we can take these player profiles and see what tradition position might be played by the players for each rotation.

| rotation | Point <br> Guard | Shooting <br> Guard | Small <br> Forward | Power <br> Forward | Center | Relative <br> height |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Bruce | Eli | Frank | Isaiah | Adam |  |
| 2 | $5^{\prime} 10$ | $5^{\prime} 8$ | $5^{\prime} 11$ | $6^{\prime} 0$ | $6^{\prime} 5$ | -2 |
| 3 | Carl | Howard | George | Adam |  |  |
| $5^{\prime} 11$ | $6^{\prime} 1$ | $5^{\prime} 10$ | $6^{\prime} 5$ | David | $6^{\prime} 4$ | +7 |
| 3 | Bruce | Carl | Howard | Frank | David |  |
|  | $5^{\prime} 10$ | $5^{\prime} 11$ | $6^{\prime} 1$ | $5^{\prime} 11$ | $6^{\prime} 4$ | +1 |
| 4 | Bruce | Eli | Carl | George | Adam |  |
|  | $5^{\prime} 10$ | $5^{\prime} 8$ | $5^{\prime} 11$ | $5^{\prime} 10$ | $6^{\prime} 5$ | -4 |
| 5 | Bruce | Howard | Frank | Adam | David |  |
|  | $5^{\prime} 10$ | $6^{\prime} 1$ | $5^{\prime} 11$ | $6^{\prime} 5$ | $6^{\prime} 4$ | +6 |
| 6 | Carl | Isaiah | George | Adam | David |  |
|  | $5^{\prime} 11$ | $6^{\prime} 0$ | $5^{\prime} 10$ | $6^{\prime} 5$ | $6^{\prime} 4$ | +6 |
| 7 | Bruce | Eli | Carl | Frank | George |  |
|  | $5^{\prime} 10$ | $5^{\prime} 8$ | $5^{\prime} 11$ | $5^{\prime} 11$ | $5^{\prime} 10$ | -12 |
| 8 | Bruce | Eli | Carl | Adam | David |  |
|  | $5^{\prime} 10$ | $5^{\prime} 8$ | $5^{\prime} 11$ | $6^{\prime} 5$ | $6^{\prime} 4$ | +0 |

Table 5.
First thing we notice, is we have short players in the forward positions for most of the game. It would be great to have a taller team, but isn't that always the case in a rec league? But we have the older, chunkier guys playing down low, rather than out on the perimeter, so Howard and Isaiah tend to play the guard positions, leaving the shorter, older, heavier guys, Frank and George to play down low.

The next thing we notice is, holy smokes, our center is $5^{\prime} 10^{\prime \prime}$ tall in the $7^{\text {th }}$ rotation! We don't have a player over six feet tall during the whole rotation. How can we fix this?

We can juggle the rotation, create a different one, that doesn't have this problem, but how could this be done automatically?

There is actually a way to create a set of rotations for an optimally "balanced" team. The question is, what is what is the quantity we want to balance? The last column shows the team height, relative to six feet. We have three tall rotations, ( 2,5 and 6 ). One very small rotation (7), and four rotations averaging within an inch of six feet. If we wanted to balance the rotation with regard to height, how could we do that?

As it turns out, there are many possible rotation possibilities. Is it feasible to try out all of the combinations to see which is most balanced? With the help of computers, there is a way to do this.

For practical purposes, rather than try to generate every possible rotation combination, we can create a set of rotations, all of which conform to some guiding principles, and then a computer can be easily be used to see which of these rotations is optimally balanced.

Here are some guiding principles we use for our rotations:

1) at least three of the five best players are always on the court.
2) five best players finish the final rotation
3) Top player gets at least $80 \%$ of the minutes
4) Lowest player gets at least $25 \%$ of minutes.
5) Higher ranked players get more minutes than lower ranked.

If we have 50 different rotations to choose from, the chances are good we can find one that is fairly balanced.

But is balancing a good idea? Trying to balance based on how TALL the players are is not a very good idea. The height of a player is not a very good measure of how BIG he plays.

A better measurement of balance is what we call HANDS, HEIGHT, and HOOPS. The MagicMetric metric can be broken down into these three separate components. HANDS, is composed of Assists, Steals, and Turnovers. HEIGHT is rebounds and blocks. And the scoring components are combined into HOOPS. An example breakdown for an NBA player might be .07 HANDS, .15 HEIGHT, and .2 HOOPS, for a .42 per minute rating.

It might seem to be a good idea to balance the lineup based on these components. But we don't know. In actual practice, the benefits of having an UNBALANCED rotation may outweigh the benefits of having a BALANCED rotation. The UNBALANCED rotations provide a different look to the opposing team. A small lineup may be very fast, while a BIG lineup may be great in the half court game.

In our experience over, eight seasons of play, the unbalanced lineups created by the rotation system seemed to a benefit rather than a detriment. As the rotations change every four or five minutes, by the time the other team adjusts to a situation to take advantage of a player mismatch, the rotation is over and a different team is on the court.

In the first season on a Winder Church team, the situation illustrated in the example actually occurred. In the seventh rotation, all the players on the floor were under six feet tall. The opposing team had a four point lead and a $6^{\prime} 8^{\prime \prime}$ center, and conventional wisdom would not field this small lineup 10 minutes before the end of the game.

Dick Mays played the role of George in this game, and took on the task of guarding their tallest player for four minutes. Dick took Judo and had strong legs and spent the next four minutes pushing on their big man and fouling him when he got the ball down low. At the end of four minutes, the Winder Church team was still down by four points, and their big man was tired. The finishing five took the court for the final 6 minutes and Winder won that game by eight points.

It doesn't always work that well, but there is no sense in fixing an issue that might not even be broken. The unusual lineups that sometimes result from use of the rotation system may actually be an advantageous bonus, as it confuses opponents and changes the game flow in a somewhat unpredictable way.

## Player Fatigue and Optimal Minutes

As long as we are talking about optimal rotations, we should address the problem of fatigue. There is no easy answer to how many minutes is optimal for any given player. In general, a player's metric/minute is probably going to be less if he plays every single minute of the game than if he gets some rest. But how much rest should he get? Does it depend on the individual player? How is it affected by age? Does it matter what player is substituted?

There are some statistical approaches that might bring some clarity to the issue. However, there are so many factors, that it is a very difficult problem to tackle quantitatively. In short, we have not done a formal statistical analysis of this problem. Instead, we suggest a qualitative guideline that the best player on the court should be playing $80 \%$ to $85 \%$ of the game. This qualitative measure is based a bit on personal experience, and a bit on observations from four years with the magicmetric.com site.

Alan Iverson averaged the most minutes per game when we ran magicmetric.com A.I. would often play close to an entire game. It was possible to look at games in which Alan played over $90 \%$ of the minutes and compare them to games in which he played under $80 \%$, and there was indeed a statistical difference in performance per minute. However, the games where A.I. averaged more minutes, may have been against tougher teams. There are simply too many too many variables to make an easy analysis of this problem.

Our belief is based more on the subjective experience of Jeff Gantner. For eight seasons, on three different teams, Jeff played with the rotation system. At 6' 5", Jeff was always the best player on the team. There were many games where Jeff played as little as $80 \%$ of the minutes and a good number where he played more than $90 \%$.

Unlike Alan Iverson, who played more or less minutes depending on the level of the competition, Jeff played more or less minutes depending on who showed up for the game. It was a recreational league, so we had rotations for $6,7,8,9,10$ and 11 players. Rarely would everybody make it to a game. In the 9 man rotation, our top two players each played 32 of 40 minutes. In the 8,7 and 6 man rotations, Jeff's playing minutes would increase up to 34,36 , and 40 minutes.

In the 10 and 11 player rotations, Jeff still got 32 minutes, but our second, third, and fourth best player all received less playing time as we tried to provide everyone with at least 10 minutes on the court.

Our gut feeling was that the nine player rotation was close to optimal. With more players we started cutting too much into the productivity of our top players. Eight players was also a good lineup if the eight players were all our top producers. But once we got down to seven players, the fatigue of the additional minutes left our finishing five without as much gas to put games away in the closing minutes.

We think our gut feeling would apply to the NBA. $80-85 \%$ is 38 to 41 minutes of a 48 minute game. This season LeBron averaged 38 minutes a game and recorded an astounding $.74 /$ minute rating. But what did he average in last year's playoffs against the Mavericks? People complained that he disappeared during the $4{ }^{\text {th }}$ quarter of key games.

Lebron played 44 minutes per game and averaged a $.45 \mathrm{MM} /$ minute. This is much, much lower than we would expect, but at least a part of this lower productivity may be due to playing so many minutes. In contrast, Dwayne Wade averaged 39 minutes per game, (in the optimal zone) and had a .69/minute rating.

We do not believe that fatigue affects player performance as much as might be extrapolated just from Lebron's performance in the 2011 Finals. However, what is a reasonable model for the effect of fatigue? We think a player's overall metric might be affected by as much as $10 \%$ if he had to play 44 minutes versus 38 .

So if LeBron averages .7 per minute playing 38 minutes a game, we might expect a $10 \%$ drop if he plays 44 minutes a game. So he can play 38 minutes at .7 but maybe when he plays 44 minutes his metric drops to a .63 . His total game metric playing 28 minutes is 26.6, but playing 44 minutes he tallies, 27.7. That is only a 1.1 increase for 6 additional playing minutes. Since the average NBA player is .4 per minute, we could expect a 2.4 contribution if we gave these 6 minutes to other players. So even being really conservative, assuming the fatigue affects production by only $5 \%$, we still get more production by substituting another average player for these minutes.

Our conclusion, More than 41 minutes per game is counterproductive in the NBA.

## The MagicMetric Coaching System

Before we move on to look at how the Rotation System might be used in the NBA, it's time for a few personal words about Coaching Philosophy. Thus far, the term MagicMetric Rotation System, and MagicMetric Coaching System have been used interchangeably. However, the MagicMetric Coaching System really has three components:

1) The MagicMetric Player Rating System
2) The Rotation System
3) The Dick Mays Coaching Philosophy

We have mentioned that the rotation system can be separated from the player rating system. In fact, one of our team players had a spouse coaching a girl's High School team and he asked to take the rotations home to show his wife. His wife liked it so much she started using it. Three years later she won a state championship using the rotations, but she seeded the players based on her own instinct rather than using the player rating system.

The third component of the Coaching System is the personal coaching philosophy of its creator, Dick Mays. Perhaps the biggest obstacle to using the Coaching System in the NBA would be a conflict of coaching philosophy. When the financial stakes are high, any form of "soft coaching," is likely to come under harsh criticism.

Dick developed his coaching philosophy during five years at the helm of the Winder United Methodist Church basketball team. The team was composed of many young players, and mentoring these young men was more important than wining basketball games. These coaching rules are:

1) No game time penalties for player mistakes
2) Developing player character is more important than winning games
3) Coaching feedback is given only with Likes and Adds

Coach Bobby Knight won three NCAA championships, and he was famous for scolding players, yanking them out of the game for mistakes. He once threw a chair across the court in a rage. This is not a coach who would want to adopt the rotation system. Knight believed in being actively involved in "coaching the game," and would never believe in a system that separates player substitutions from other game time decision. This "field general," mentality, with the coach actively calling the shots on the field of battle, is a popular coaching style, from youth leagues to the NBA. Appropriately, Bobby Knight was nicknamed "The General."

Mike Krzyzewski played under Bonny Knight at West Point, and was his assistant coach at Indiana. But unlike his mentor, Krzyzewski rarely displays emotional rage on the basketball court. Dean Smith, the long time coach at North Carolina has a similar coaching style, displaying a calm demeanor during games, no matter what the game decision. These two coaches have 6 NCAA championships between them, showing that there is more than one style of coaching that can be successful on the court.

Duke and North Carolina are two teams that regularly use a deep, nine/ten player rotation and both of these programs have been extremely successful. Either of these coaches might be open to using the rotation system as it already has similarities to the way they manage games. However, there are other coaches who prefer to keep their best players on the court a higher percentage of the time. As an example, Bobby Cremins, famous for playing as few as six players, would not be a good match for the rotation system.

The Dick Mays philosophy came partly from his experience directing plays, and studying acting. The rehearsal is the time to give performers feedback on their technique. When the show goes up, only positive feedback is of value. Players need their confidence boosted to give their best performance, and don't need to be worried about the coaches wrath. This is as true on the court as it is on the stage.

Players have earned their minutes, by their performance and conduct, and they know at game time exactly when and how long they will play. This allows players to take responsibility for their own performance. If they foul out, they lose their minutes; otherwise, baring injury, they get their minutes determined by the rotation.

What if a player is sick, or injured, or not at full strength? That becomes the player's call rather than the coach's. They have earned their minutes, but if they are less than $100 \%$ they may prefer to sit out the game, or play fewer minutes. There is nothing that trashes a player's rating more than playing a lot of minutes at a low level of play. Players wanting to keep their player rating high will voluntarily come out of a game instead of trying to play on a twisted ankle.

Conduct can affect a player's minutes. If a player receive a Technical Foul for almost any reason, or the coach deems that the player has committed a conduct violation, the player loses one spot in the rotation order for the next game. A second conduct violation results in 2 spots down on the rotation, and a third in suspension from a game. This was what was told to the players, however in many years of play, it was never necessary to penalize a player more than once.

A conduct violation also included any criticism of a teammate. Team players build up their teammates and any criticism of a mistake or anger expressed towards a teammate was a conduct violation.

Would this work in the NBA? How would Kobe react to losing his top spot for criticizing Paul Gasol? It would be fun to find out. The Magic Metric coaching system provides consequences for actions, but is never punitive in intent. It encourages players to take responsibility for their own productivity, rewards good play with more minutes, and treats all players equally.

Why wouldn't a professional NBA player want to play under this system?

## An NBA Rotation

Using the same guiding principle, we can create a rotation for the NBA in which players get rewarded with more playing the better they perform. Then we can take some actual NBA teams, and see the positions in which the players might play using this rotation. Just as with the Recreational League, we will see that there are some unusually rotations that result. But how would such as system work in actual practice. Unless this paper finds its way across an interested NBA executives desk, we will probably never know.

Table 6 is a nine player rotation designed for four 12 minute quarters. It meets all five of our guiding principles.

1) At least three of the five best players are always on the court.
2) The five best players finish the final rotation
3) Top player gets at least $80 \%$ of the minutes
4) Lowest player gets at least $25 \%$ of minutes.
5) Higher ranked players get more minutes than lower ranked.

Nine player NBA rotation:

|  | $1^{\text {st }} \mathrm{Qtr}$ |  |  | $2^{\text {nd }} \mathrm{Qtr}$ |  |  |  | $3^{\text {rd }} \mathrm{Qtr}$ |  |  | 4th Qtr |  |  | Playing <br> Time |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 12 | $7: 00$ | $5: 00$ | 12 | $8: 00$ | $6: 00$ |  | 12 | $7: 00$ | $5: 00$ | 12 | $9: 00$ | $5: 00$ |  |  |
|  | X |  | X |  | X | X |  | X | X | X | X | X |  | X | 39 |
|  | X | X |  | X | X | X |  | X |  | X |  | X | X | 38 |  |
|  | X | X | X |  | X | X |  |  | X | X | X |  | X | 36 |  |
|  |  | X | X | X | X |  |  | X | X |  | X | X | X | 32 |  |
|  |  | X |  | X |  | X |  |  | X | X |  | X | X | 28 |  |
|  | X |  | X | X |  |  |  |  | X |  | X | X |  | 22 |  |
|  |  |  | X |  |  | X |  | X |  |  |  | X |  | 19 |  |
|  |  | X |  | X |  |  |  | X |  |  | X |  |  | 14 |  |
|  | X |  |  |  | X |  |  |  |  | X |  |  |  | 12 |  |

Table 6.
There are many other rotations that could be created meeting the same design goals. But this one looks as reasonable as any. We can take a couple an actual NBA teams and see how it would work with this rotation. For illustrate purposes, we will pick a likely contender for the NBA 2012 Championship. The San Antonio Spurs.

Table Seven shows the players with more than 100 minutes of floor time for the Spurs during the 2011-2012 season. It is interesting to see that we have the top three players listed as Tim Duncan, Tony Parker, and Manu Ginobili. Two of the best backcourt players, and an All time great at Center. The Spurs also have a slew of competent, forwards with six players in this position beating the .37 NBA average metric. It is no wonder they are a contender for the title. But how do we cut the players to pick our optimal nine man rotation?

Here is where we get to play general manger. (Actually coach, since the GM gets us the team, and the coach get to decide how to play them.) You did watch Moneyball?

If we use the rotation system it will decide the lineups for us, but we need to insure we have the right mix of players. Or do we? What if we just pick the top rated nine players?

| NBA <br> Rank | Player | $\mathrm{MM} / \mathrm{g}$ | $\mathrm{MM} / \mathrm{min}$ | Mins | Height | Position |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 18 | T. Duncan | 17.64015 | 0.616789 | 1634 | $6^{\prime} 11$ | C/F |
| 25 | T. Parker | 18.01912 | 0.556146 | 1923 | $6^{\prime} 2$ | G |
| 38 | M. Ginobili | 14.18214 | 0.593395 | 792 | $6^{\prime} 6$ | G |
| 95 | T. Splitter | 10.1553 | 0.543064 | 1121 | $6^{\prime} 11$ | F |
| 123 | D. Blair | 9.76 | 0.483168 | 1363 | $6^{\prime} 7$ | F |
| 138 | K. Leonard | 10.30417 | 0.42934 | 1534 | $6^{\prime} 7$ | F |
| 143 | P. Mills | 7.484091 | 0.584695 | 261 | $6^{\prime}$ | G |
| 144 | D. Green | 10.09257 | 0.433157 | 1522 | $6^{\prime} 6$ | F |
| 181 | G. Neal | 8.675 | 0.421117 | 1206 | $6^{\prime} 4$ | G |
| 197 | B. Diaw | 8.6 | 0.396313 | 406 | $6^{\prime} 8$ | C/F |
| 205 | S. Jackson | 8.481034 | 0.375267 | 500 | $6^{\prime} 8$ | F |
| 214 | R. Jefferson | 9.306098 | 0.32653 | 1168 | $6^{\prime} 7$ | F |
| 228 | M. Bonner | 7.174658 | 0.364196 | 1326 | $6^{\prime} 10$ | F |
| 305 | T. Ford | 4.975 | 0.365809 | 101 | $6^{\prime} 0$ | G |
| 395 | J. Anderson | 3.189474 | 0.295322 | 603 | $6^{\prime} 6$ | G |
| 436 | C. Joseph | 2.32931 | 0.253186 | 266 | $6^{\prime} 3$ | G |

Table 7
By looking at the total number of minutes played, we get some idea of the perceived value of players by the existing coaching staff. Richard Jefferson and Matt Bonner are logging significant minutes, but neither are listed in the top ten in our rating system. Patrick Mills, a native Australian is a very interesting newcomer with a .58 per minute rating. Even though the Spurs have two great backcourt players in Parker and Ginobili, it would be interesting to give Patrick Mills more minutes. It is doubtful his rating would remain that high if he were logging significant minutes. Tim Duncan might also object to playing 39 minutes a game. He is currently averaging 28 . But hey, a system is a system, so we fill out our rotation with our top nine players.

|  | $1^{\text {st }} \mathrm{Qtr}$ |  |  | $2^{\text {nd }} \mathrm{Qtr}$ |  |  |  | $3^{\text {rd }} \mathrm{Qtr}$ |  |  | 4th Qtr |  |  | Playing <br> Time |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Player | 12 | $7: 00$ | $5: 00$ | 12 | $8: 00$ | $6: 00$ |  | 12 | $7: 00$ | $5: 00$ | 12 | $9: 00$ | $5: 00$ |  |
| T. Duncan | X |  | X |  | X | X |  | X | X | X | X |  | X | 39 |
| T. Parker | X | X |  | X | X | X |  | X |  | X |  | X | X | 38 |
| M. Ginobili | X | X | X |  | X | X |  |  | X | X | X |  | X | 36 |
| T. Splitter |  | X | X | X | X |  |  | X | X |  | X | X | X | 32 |
| D. Blair |  | X |  | X |  | X |  |  | X | X |  | X | X | 28 |
| K. Leonard | X |  | X | X |  |  |  |  | X |  | X | X |  | 22 |
| P. Mills |  |  | X |  |  | X |  | X |  |  |  | X |  | 19 |
| D. Green |  | X |  | X |  |  |  | X |  |  | X |  |  | 14 |
| G. Neal | X |  |  |  | X |  |  |  |  | X |  |  |  | 12 |

Table 8.

Here's how the 12 rotations look, with relative height based on NBA average of 6' 7 .

$\left.$| rotation | Point <br> Guard | Shooting <br> Guard | Small <br> Forward | Power <br> Forward | Center |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | | Relative |
| :---: |
| height $6^{\prime} 7$ | \right\rvert\,

Table 5.
You know, you gotta be a real geek to analyze each of these rotations. I will leave it as an exercise for the interested reader. But, I kind of like this team's chances, if Duncan doesn't die of a heart attack. Some interesting lineups emerge.

## Conclusion

It's not very likely that any NBA team will buy into this unconventional approach. However, this paper might intrigue a High School or College coach enough to give it a try. Coaches may feel free to use any or all of this material without restrictions. But your experiences with the system are valuable. Please send experiences, both positive and negative to dick DOT mays AT gmail.com. Thank you.

Appendix: 2011-2012 NBA Player rankings based on product of MM/g and MM/min.

| Rank | Player | MM/g |  | MM/min |
| :---: | :---: | :---: | :---: | :---: | MM Product

| 45 | R. Hibbert | 15.366 | 0.515638 | 7.923287 |
| :---: | :---: | :---: | :---: | :---: |
| 46 | K. Humphries | 16.57258 | 0.476224 | 7.892254 |
| 47 | J. Noah | 15.50821 | 0.508466 | 7.885395 |
| 48 | E. Gordon | 16.42222 | 0.476006 | 7.817084 |
| 49 | J. Jack | 16.23889 | 0.477614 | 7.755927 |
| 50 | Nene | 14.75641 | 0.517769 | 7.640409 |
| 51 | A. Bargnani | 15.79516 | 0.474329 | 7.492106 |
| 52 | A. Stoudemire | 15.65784 | 0.47448 | 7.429335 |
| 53 | J. Johnson | 16.31061 | 0.454334 | 7.41047 |
| 54 | R. Gay | 16.65625 | 0.444167 | 7.398151 |
| 55 | A. Horford | 15.50714 | 0.475679 | 7.376426 |
| 56 | M. Ellis | 16.22619 | 0.450728 | 7.31359 |
| 57 | B. Lopez | 14.07 | 0.517279 | 7.278121 |
| 58 | J. McGee | 14.08293 | 0.512106 | 7.211957 |
| 59 | D. Gooden | 13.74375 | 0.524571 | 7.209567 |
| 60 | T. Chandler | 15.43134 | 0.464799 | 7.172481 |
| 61 | D. Granger | 15.55903 | 0.458968 | 7.141102 |
| 62 | A. Iguodala | 16.03716 | 0.444243 | 7.124393 |
| 63 | N. Pekovic | 13.84255 | 0.514593 | 7.123282 |
| 64 | K. Faried | 12.79906 | 0.551683 | 7.061028 |
| 65 | T. Evans | 15.51032 | 0.452196 | 7.013701 |
| 66 | M. Thornton | 15.54412 | 0.44539 | 6.923198 |
| 67 | J. Calderon | 15.21981 | 0.448962 | 6.833117 |
| 68 | M. Conley | 15.41377 | 0.434191 | 6.692514 |
| 69 | S. Ibaka | 13.502 | 0.494579 | 6.677802 |
| 70 | A. Jamison | 14.75385 | 0.445736 | 6.576313 |
| 71 | A. Bogut | 14.10417 | 0.465484 | 6.565265 |
