A new type of nano-sized polypyrrole (PPy) actuator was fabricated by an electrochemical polymerization into an anodized aluminum oxide (AAO) template.

The nanorod PPy was characterized by a cyclic voltammetry and SEM. The volume-change of the actuator was observed by SEM according to the activated in different salts: sodium chloride, tetrabutylammonium perchlorate (TBAClO<sub>4</sub>), dodecyl benzene sulfonic acid (DBSA), n-butyl-3-methyl imidazolium tetrafluoroborate (BMIBF<sub>4</sub>), n-butyl-3-methyl imidazolium hexafluorophosphate (BMIPF<sub>6</sub>) and n-butyl-3-methyl imidazolium bis(trifluoromethanesulfonyl) imide (BMITFSI). The linear displacement increased with increasing the anion-size of the salts in liquid electrolytes.

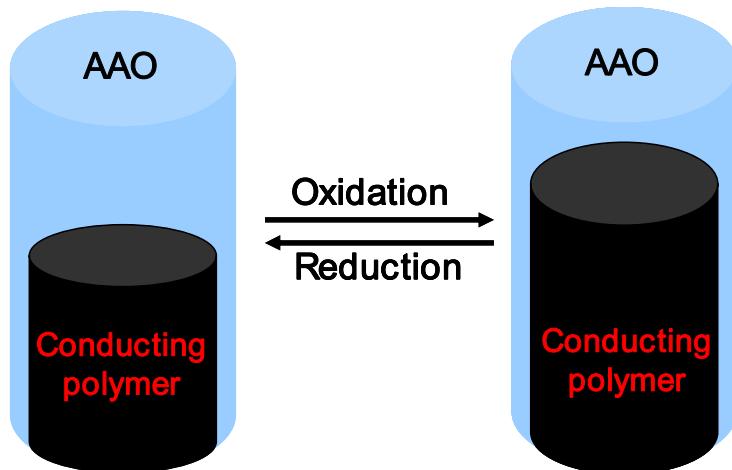

Figure 1: Schematic linear actuation of PPy nanorod
